## Disclaimer

This report covering solid organ transplantation on a national scale is very unique worldwide in its completeness and comprehensiveness. Transplanted organs and organ combinations included in this report are: heart, kidney (including kidney-kidney), kidney-liver, kidney-pancreas, kidney-lung, kidney-islets, liver, pancreas, islets, lung, lung-liver, and small bowel. These outcome data reflect very well the transplant activity in Switzerland as a whole but do not allow firm comparisons between the various transplant centers. Importantly, the individual transplant centers are responsible for patient selection (wait listing) and for the acceptance of a given organ allocated by Swisstransplant. As a consequence, there may be outcome differences! Furthermore, patient numbers per center, such as for instance in heart and pancreas transplantation, are relatively small. Nevertheless, one may not expect major differences with respect to patient and graft survival between our transplant centers. The survival data are completed by prevalent and incident (skin) cancer reports.

## 2 News and updates

### News:

- Numbers of all single kidney and single liver transplantation(s) (Tpx) are presented, in total and separated by donor type and centre.
- Rates of infectious disease (ID) events are numerically shown in addition to the graphic.
- Cumulative incidence functions of graft failure (GF) for major Tpx are shown separated by the number of HLA mismatches.

### Updates:

- Infection data were modified regarding missing pathogen information but given 'other' information. For example, the exact virus information is missing even though an 'other virus' is specified. In this case, virus will be re-specified by 'Other viruses'.
- For mortality and graft failure free survival analyses, single and double Kidney Tpx are shown together.
- The term 'graft failure' is re-defined as graft failure and primary non-function of the allograft. It concerns graft failure free survival and cumulative incidences of graft failures analyses.
- Information about missing cancer and skin cancer information is removed as it needs a quality monitoring.

### 3 Patients, transplantations and transplanted organs

Definitions applied:

- Enrolment refers to inclusion of all patients into the Swiss Transplant Cohort Study (STCS) from 1st of May 2008 until 31th of December 2014.
  - From those patients, all information until the date of data extraction (11th of August 2015) is included in the report.
- First transplantation(s):
  - Patients with a first transplantation(s) (Tpx) in their medical history at the time of STCS enrolment
- Re-transplantation(s):
  - Patients with a repetition of the same Tpx type
  - Example: Re-Tpx of a kidney allograft after failure of a prior kidney graft
- Second transplantation(s):
  - Patients with a second Tpx different from the previous Tpx either before STCS enrolment or during STCS follow-up (FUP)
  - Example: Tpx of a pancreas following a (successful) single kidney Tpx
  - Double/triple Tpx can qualify for both, re- and second Tpx
- Every Tpx can consist of a single, double or triple transplant(s). The terms 'double' and 'triple' refer to Tpxs in which multiple organs originating from the same donor are transplanted in a recipient (e.g. kidney-pancreas double transplant).
- Tpx prior to STCS enrolment have also been considered. Patients may thus start with a re- or a 2nd Tpx in STCS.
- Sequences of previous islet Tpx have been counted as one prior Tpx and bone marrow Tpx are excluded from the report.

### 3.1 Overview

The following tables list the number of patients enrolled in the STCS, Tpx performed, and organs transplanted. Table 1 and 2 show patients according to their first STCS Tpx.

Table 1: Number of patients enrolled

	Patients	(%)
Total number	3034	100.0
Single Tpx at enrolment	2880	94.9
Double Tpx at enrolment	150	4.9
Triple Tpx at enrolment	4	0.1
1st Tpx at enrolment	2658	87.6
Re-Tpx at enrolment	300	9.9
2nd Tpx at enrolment	76	2.5

## 4 Consent status

Patients in STCS may change their consent status. Figures 16 and 17 show patients' current consent status (by centre). Table 6 shows patients' status update (from enrolment (row, 'E') to a more current date (column, 'C')).

Figure 16: Current patients' consent status

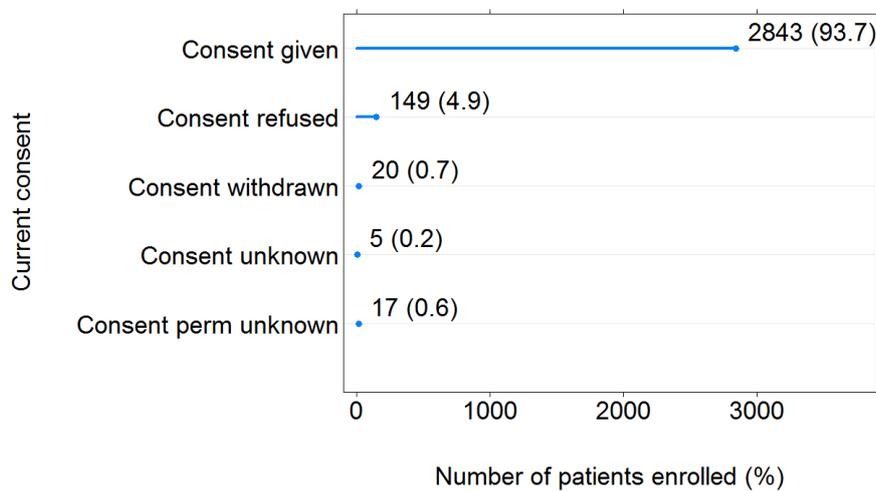

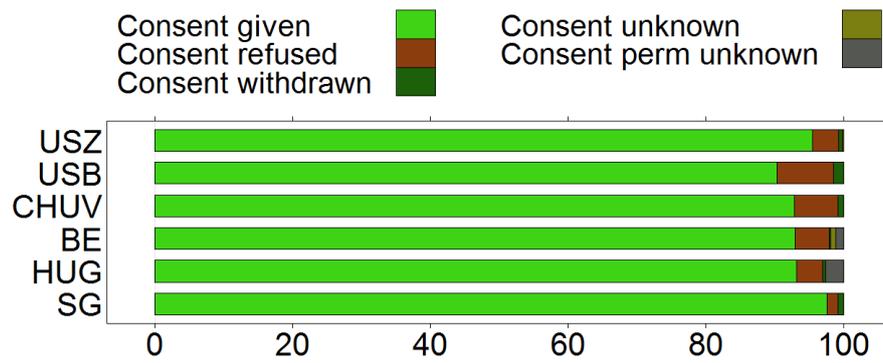

Table 6: Patients' current consent (columns) against consent status at enrolment (rows)

	Total	C-Given	C-Refused	C-Withdrawn	C-Unknown	C-Perm unknown
Total	3034	2843	149	20	5	17
E-Given	2839	2819	0	20	0	0
E-Refused	151	3	148	0	0	0
E-Withdrawn	0	0	0	0	0	0
E-Unknown	28	21	1	0	5	1
E-Perm unknown	16	0	0	0	0	16

Remark: 'C' means 'current consent status' and 'E' denotes the consent status at enrolment.

In Figure 17, current patients' status (i. e. last known consent status) is given proportionally within each centre.

Figure 17: Current patients' consent status by centre

Proportions of current consent types for patients (% by centre)

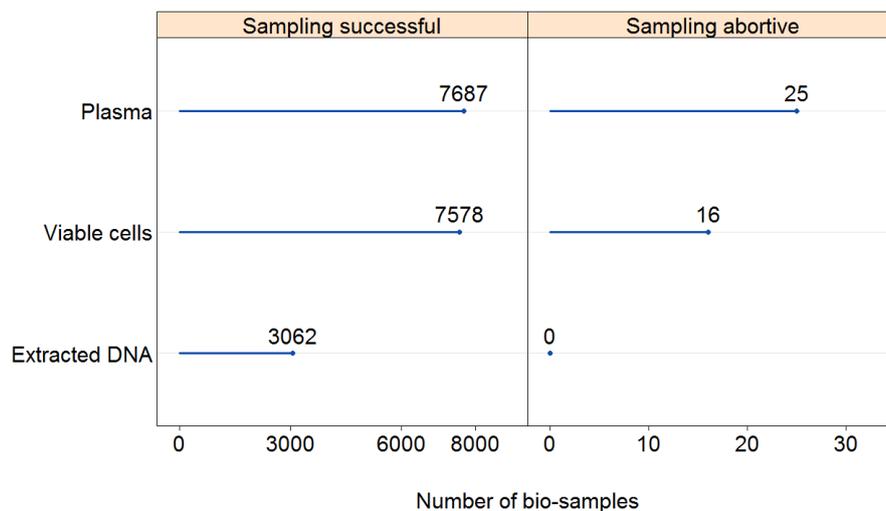

## 5 Bio-samples

Table 7 presents the number of patients with and without bio-samples. The consent status for patients with at least one bio-sample is at the time point of the first drawn bio.sample. Consent status at enrolment is taken for patients without any bio-samples.

Table 7: Number of patients with bio-samples

	Total	Sample (%)	No sample (%)
Total	3034	2836 93.5	198 6.5
Consent given	2849	2819 98.9	30 1.1

Figure 18: Number of bio-samples in STCS

Remark: Sampling is defined as abortive if no aliquots were stored.

## 6 Infectious disease events

In Tables 8 and 9, descriptive information about patients with infectious disease (ID) events and types of ID events are given. Table 10 and Figure 20 give ID event rates by Tpx and pathogen type.

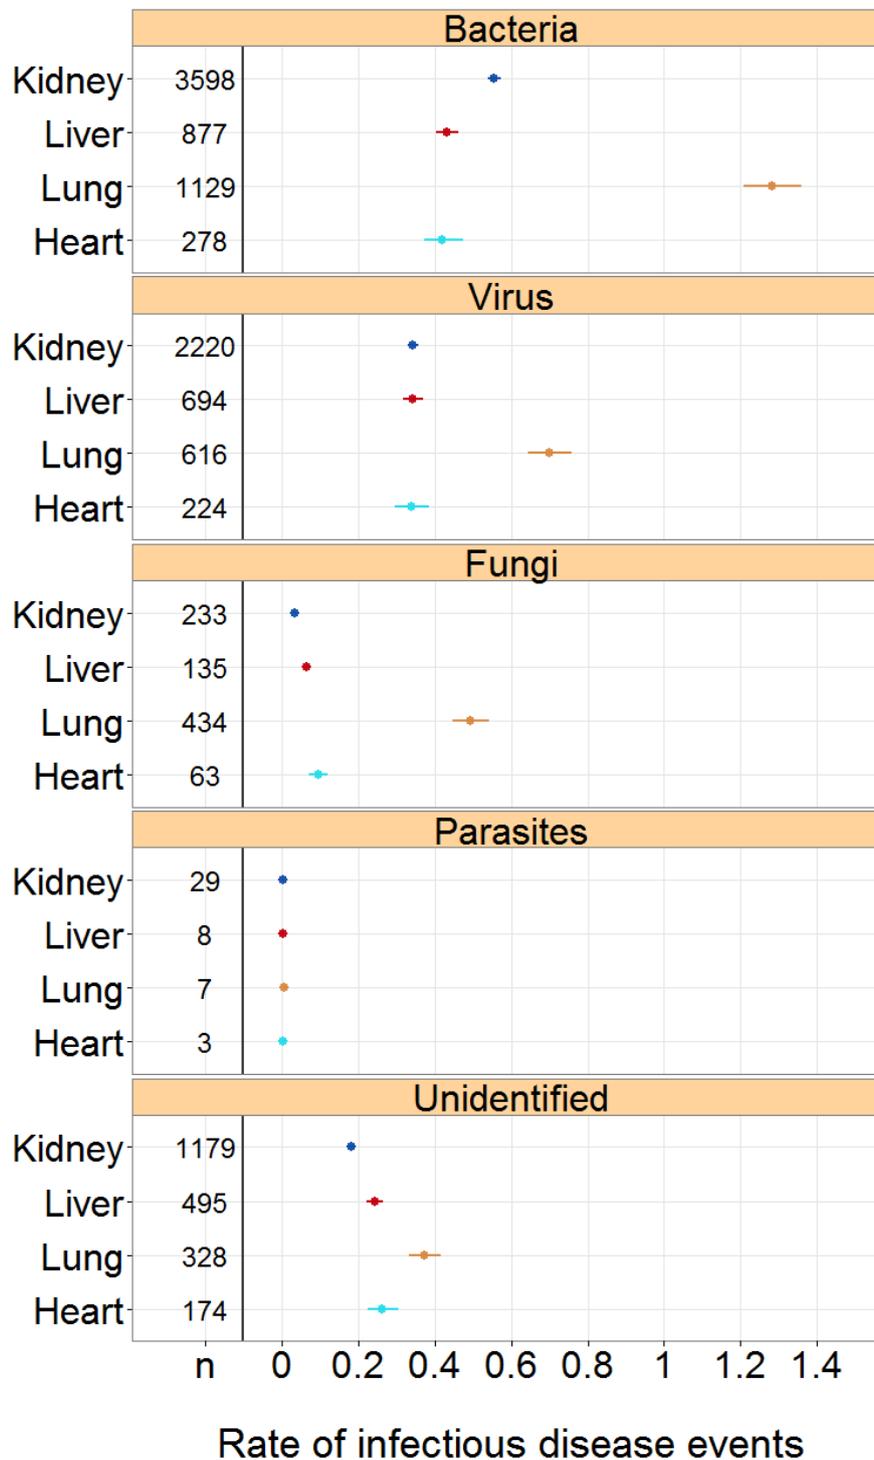

Table 8: Patients with infectious disease events

	N	% (sd)
Total number of patients	3034	
Patients with at least one ID event	2306	76%
- Number of ID events, mean (sd)	5.9	(5.4)
Patients with at least one proven/viral ID event	1659	54.7%
- Number of proven/viral ID events, mean (sd)	3	(2.8)

Table 9: Summary of infectious disease events

	N	(%)
Total number of ID events	13603	100.0
Proven disease	4834	35.5
Viral syndrome	99	0.7
Primary infection	44	0.3

Asymptomatic	2271	16.7
Colonization	3062	22.5
Possible disease	43	0.3
Fever neutropenia	11	0.1
Information missing	266	2.0

Figure 20: Rate of infectious disease events by pathogen and Tpx type

Remark: The rate of ID events is defined as the number of ID events per year of observation time. It is calculated as number of ID events divided by the total observation time of patients at risk.

Table 10: Rate of infectious disease events by pathogen and Tpx type

## 7 Follow-up

Percentages in Figures 21 and 22 have to be read as proportions of Tpx for which at least the 6 month or the 12 month FUP visit was performed.

Figure 21: Number of Tpx with 6 month FUP

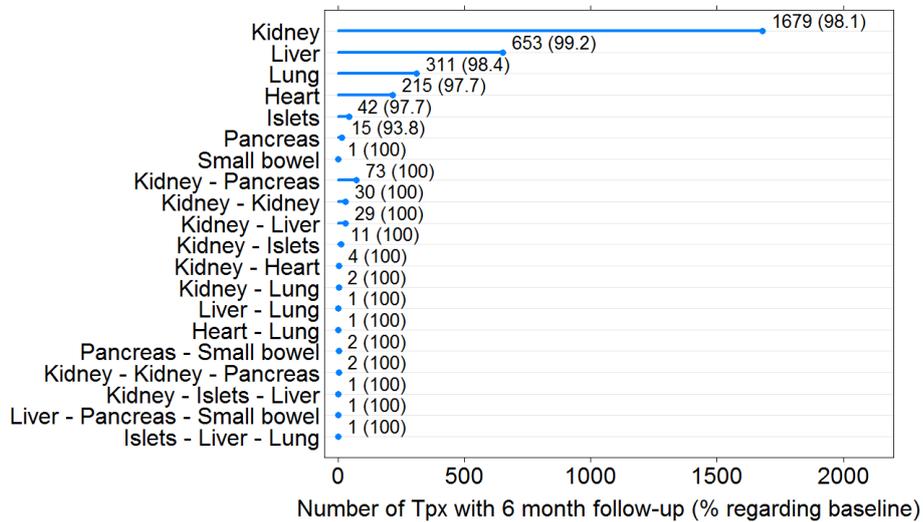

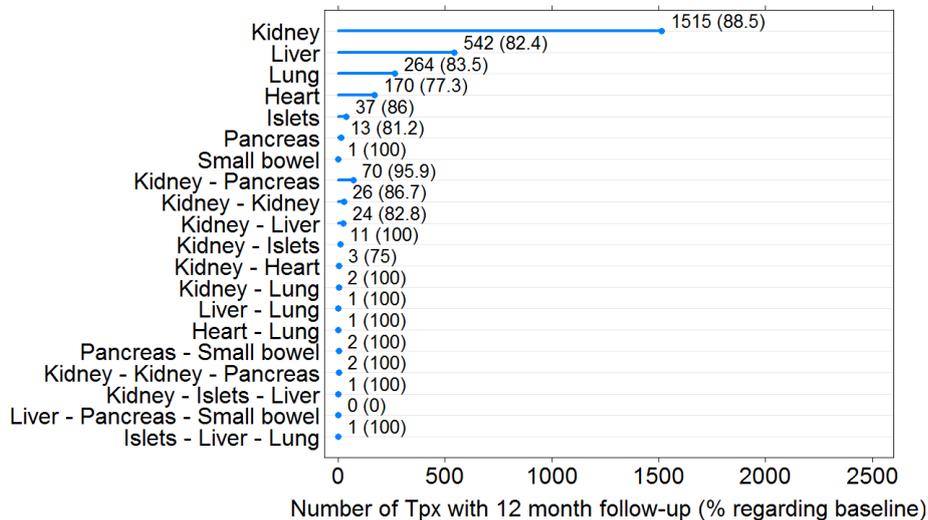

Figure 22: Number of Tpx with 12 month FUP

## 8 Mortality

In the following, survival rate estimates can only be descriptively interpreted since the precision is low due to the small number of patients at risk at the end of FUP. In Figure 23, the 95%-confidence interval (CI) is given. Furthermore, survival rate estimates are not adjusted for potential risk factors (in Figures and Tables).

## 8.2 Mortality by Tpx

For the issue of clarity, Tpx types performed in STCS are separated in frequent and rare Tpx scenarios regarding their frequency of occurrence. Rare Tpx (unless Islets Tpx) are performed less than 30 in STCS so far. Figures and Tables are thus potentially given per frequent and rare Tpx (see Appendix A).

Figure 24: Overall survival for frequent Tpx types

Remark: 30 Kidney-Kidney Tpx are included in Kidney Tpx.

### 8.4 Mortality in first single kidney Tpx

Overall survival for patients with single kidney Tpx as first STCS Tpx is presented separated by the donor type. In Figure 27, category 'Living' is separated in 'Living, ABO c' and 'Living, not ABO c'. The letter 'c' means 'compatible'.

## 9 Graft failure and primary non-function

Failure and primary non-function in an allograft are considered as one. No distinction is therefore made in this section.

### 9.1 Graft failure

Graft failures (incl. grafts with primary non-function) are counted on organ-level (Tables 18 and 19). Table 17 gives a summary of numbers of graft failures on patient- and organ-level. In addition to, numbers of organs with primary non-function are given separately in Table 20.

Table 17: Summary for graft failures

	N	(%)
Graft failure - total	275	100.0
- in single Tpx	245	89.1
- in double Tpx	30	10.9
Patients with at least one graft failure	249	
Patients with graft failure or death	518	100.0
- graft failure and alive at end of follow-up	133	25.7
- graft failure followed by late death	66	12.7
- graft failure related death (at same day)	50	9.7
- death without any graft failure	269	51.9

Remark: Only double tpx with at least one graft failure are listed.

Pancreas	95	19	20	2	10.5	0	0

\* GF: graft failure (incl. primary non-function)

Remark: Islet and small bowel graft failures are disregarded.

## 9.2 Graft failure free survival

In the following, rate estimates for graft failure free survival are not adjusted for potential risk factors. In Figure 28 and 29, both single kidney and double kidney Tpx are included as mentioned previously. In contrast, Figure 30 shows graft failure free survival only for patients with first STCS single kidney Tpx.

Figure 28: Graft failure free survival by major Tpx

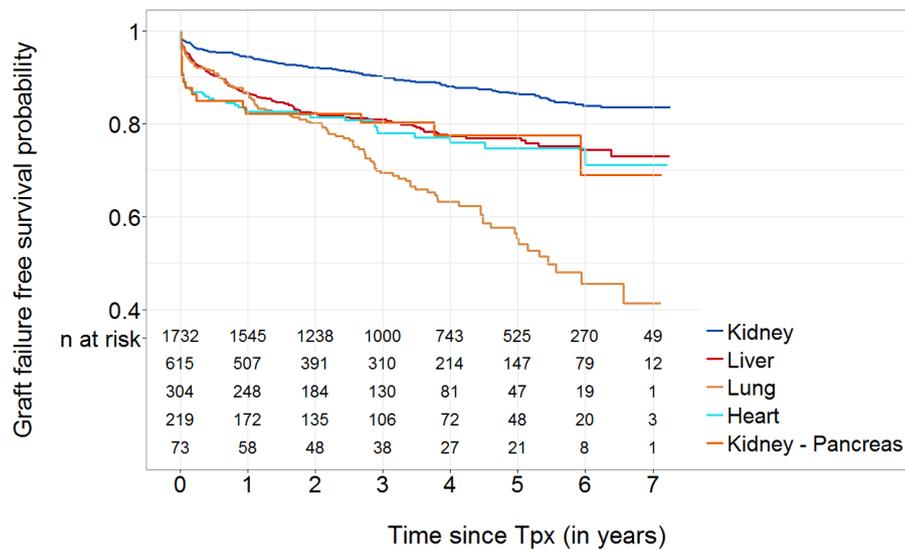

Figure 29: Graft failure free survival by major Tpx and centre

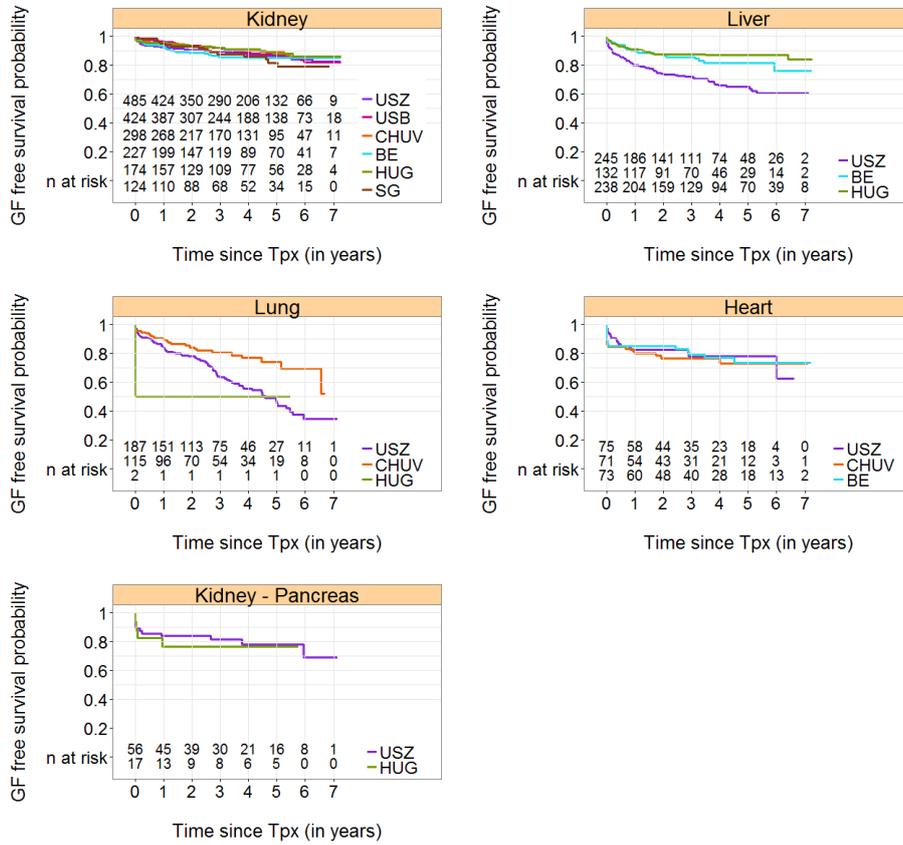

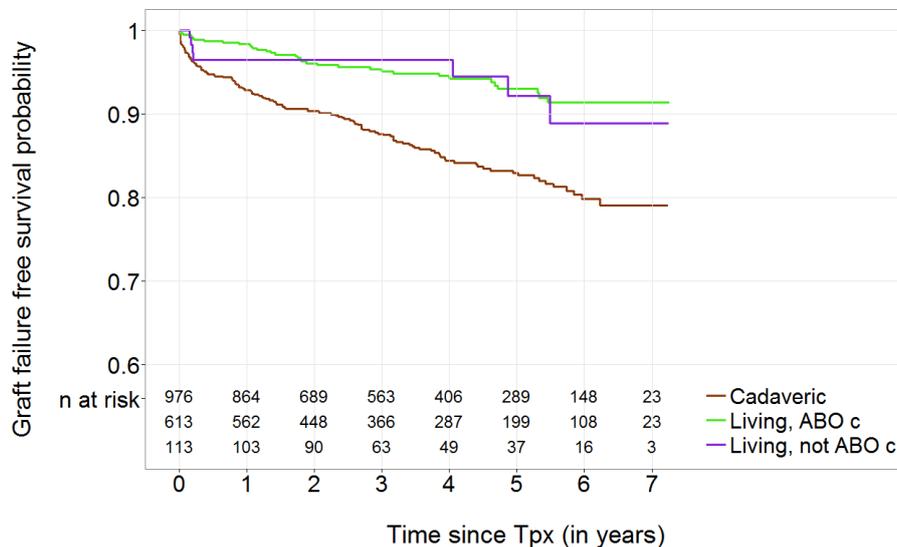

Figure 30: Graft failure free survival in patients with first STCS single kidney Tpx by donor type (combined with ABO compatibility)

### 9.3 Cumulative incidence of graft failure

The cumulative incidence(s) (CumInc) of a graft failure is the probability for a graft failure within the reported time period. CumInc functions for graft failure are not adjusted for potential risk factors (illustrated in Figures and Tables).

Figure 31: Cumulative incidences of graft failure for organs with at least one graft failure

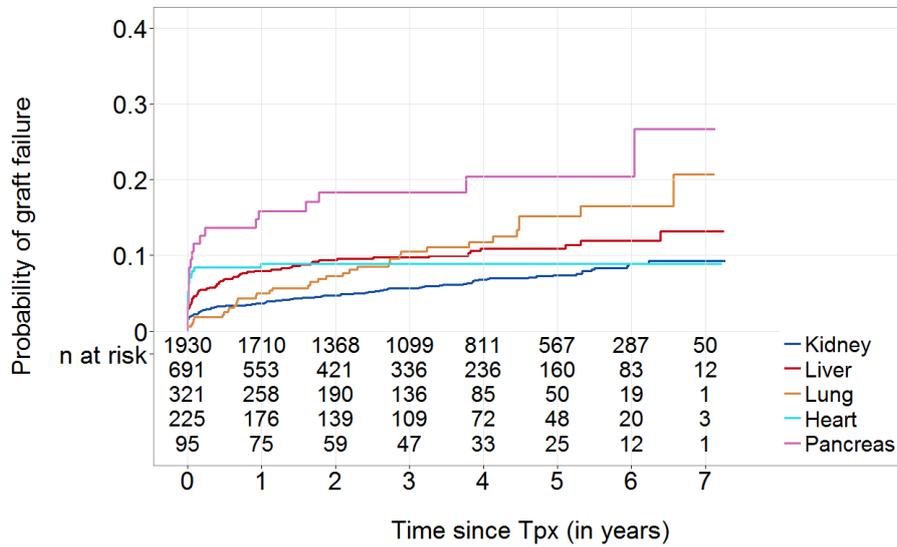

Figure 32: Cumulative incidences of graft failure for kidneys in single Tpx by donor type

### 9.4 Graft failure and number of HLA mismatches

Figures 34-37 show cumulative incidence functions for graft failures separated by (major) tpx and the number of HLA mismatches<sup>1</sup> between donor and recipient at baseline (i. e. at timepoint of first STCS tpx). It is distinguished between mismatches for HLA-A, HLA-B and HLA-DR and the total number of mismatches of these HLA classes.

Figure 34: Cumulative incidences of graft failure for kidney or kidney-kidney tpx by HLA mismatches

<sup>1</sup>The number of mismatches are the number of HLA surface receptor classes of the donor not present in the recipient. If the surface receptors of the donor are homozygous, they are counted only once. Groups with less than 10 patients at time of tpx are not shown. The number of patients at risk for some tpx is lower compared to the number of tpx due to missing HLA information.

Figure 35: Cumulative incidences of graft failure for liver tpx by HLA mismatches

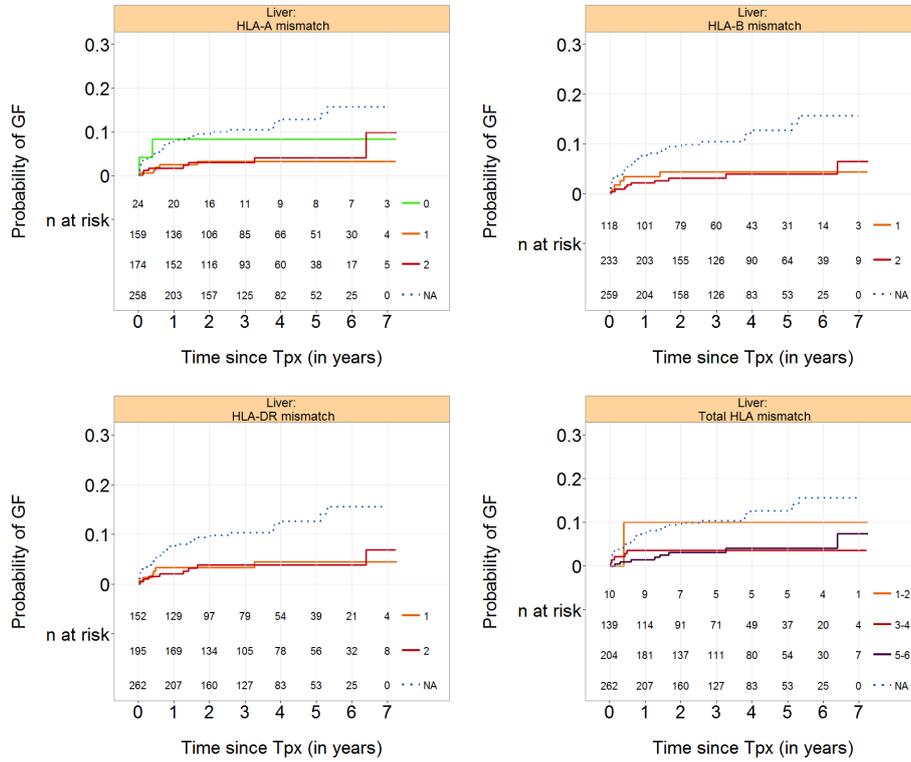

Figure 36: Cumulative incidences of graft failure for lung tpx by HLA mismatches

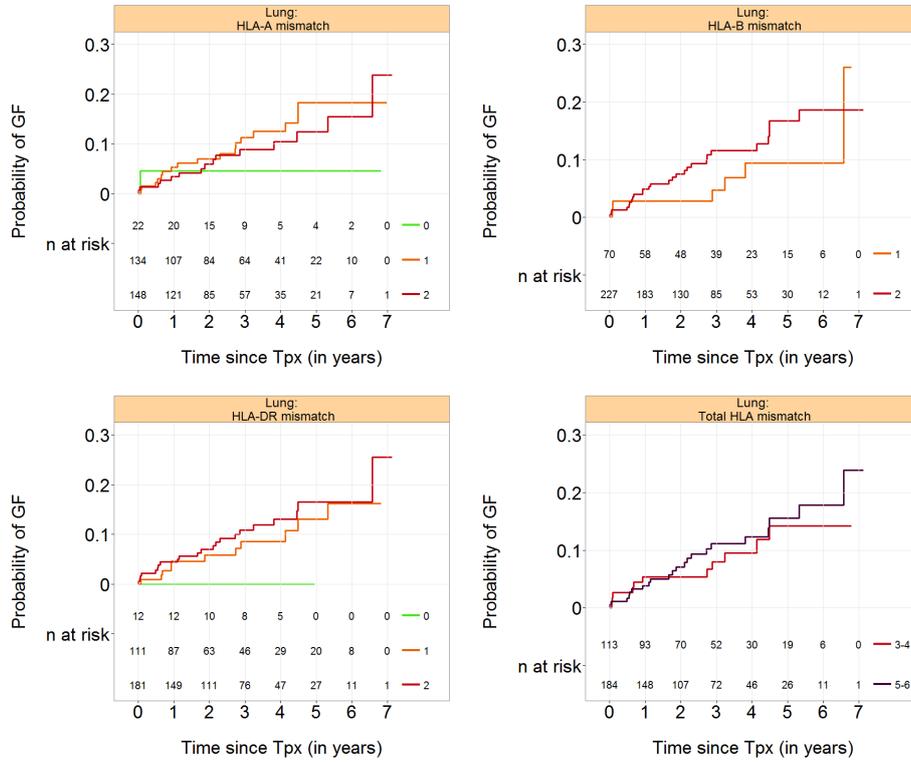

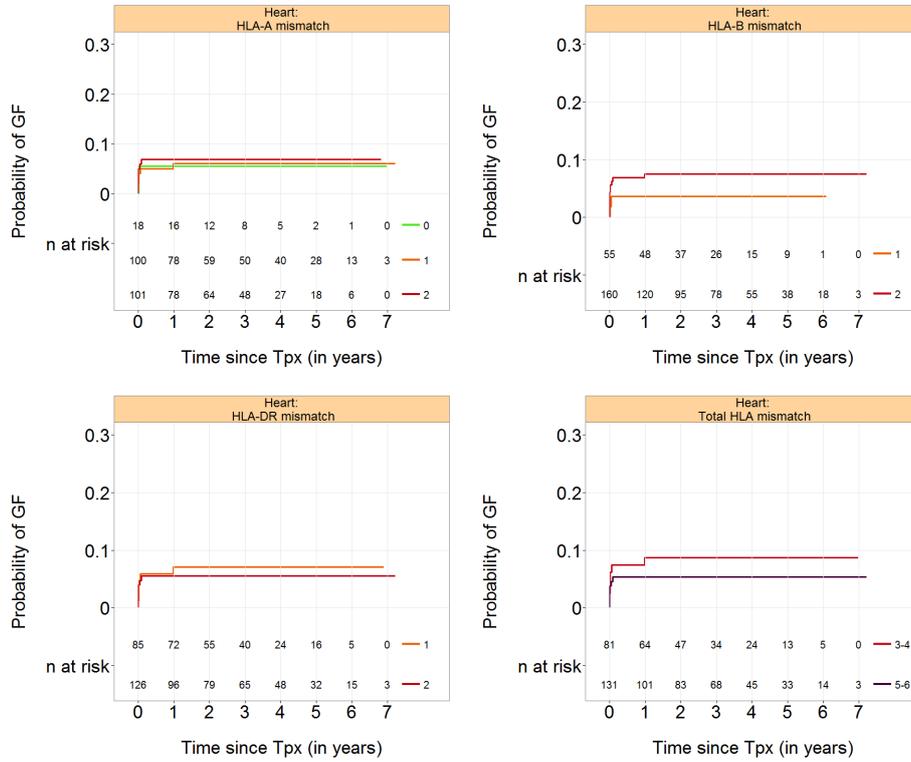

Figure 37: Cumulative incidences of graft failure for heart tpx by HLA mismatches
